VersionOne, recognized by agile practitioners as the leader in agile project management tools, today launched a comprehensive suite of agile visualizations in its Winter 2013 product release focused on enabling teams to more easily identify problems and collaborate.

"Visualization is becoming increasingly important in better understanding complex relationships. In the context of agile software development, our suite of visualizations can really help teams understand rapidly changing relationships and dependencies occurring during the software development lifecycle. With our Winter 2013 release, we've taken the next major step in simplifying project collaboration and making sure everyone on the team understands the impact their work is having on the overall program goals," said Robert Holler, president and CEO of VersionOne. "This makes it much easier for teams to achieve their goals in a more holistic manner."

VersionOne's new visualizations help users identify impediments in their agile processes. They make it easier for users to understand and manage complex work item relationships and dependencies. Project dependency diagrams help team members see schedule anomalies, helping them to sequence work within a release. Additional improvements for Enterprise Edition include enhanced cross-project visibility for epics and streamlined epic breakdown, simplifying agile portfolio and program management.

About VersionOne

VersionOne is recognized by agile practitioners as the leader in agile project management tools. By simplifying the planning and tracking of agile projects, we help teams deliver better software faster.
