Quality First Software GmbH has released version 3.5.2 of their professional test automation tool for Web and Java GUIs.

Most notable features added since the release start of the previous 3.4 branch in May 2011 are the concept of grouping and managing test-suites in projects, Daemon communication now secured via SSL, new support for AJAX toolkits Vaadin, ZK and PrimeFaces, full sub-item support for several AJAX toolkits, integration with test management tool QMetry, updated support for Firefox up to current 23, updated support up to Eclipse versions 4.3 and 3.8.2, ExtJS version 4 and RichFaces version 4, for Testlink 1.9.7 and several extensions to the standard library qfs.qft. QF-Test generally features easy to use capture/replay for effective recording of test cases for Java- (Swing, SWT, Eclipse plug-ins and RCP, ULC, Web Start, applets) and web-based applications (HTML, AJAX, explicitly GWT, RAP, Qooxdoo, Richfaces, ExtJs, ExtGwt, Vaadin, ZK and Primefaces). Advanced options like structuring and modularization strongly increase the reusability of system tests and thus reduce the maintenance effort. Expert functions like scripting in Jython or Groovy allow powerful under-the-surface access. QF-Test is ideal for the automation of functional regression and load testing.
